Hb

This is a fluorescence microscopy image of a brain section. The image shows a coronal slice of a brain with a central vertical line and a horizontal line intersecting at the center. The brain tissue is stained with a blue fluorescent dye, likely DAPI, which highlights the nuclei of cells. The staining is most intense in the central region, particularly around the midline, and fades towards the periphery. The overall shape of the brain section is roughly oval, with some internal structures visible as darker or lighter blue areas.
