SPa ventral

This fluorescence microscopy image displays a ventral view of a SPa (likely a Spalangia fly). The image is characterized by two large, symmetrical, blue-colored lobes that dominate the central area. A thin, light-colored horizontal line bisects the image, and a vertical line runs down the center. At the intersection of these lines, there is a small, bright, yellowish-green spot. The background is black, and the overall appearance is that of a scientific specimen under a microscope.
