DM

This is a brain MRI scan, likely a T2-weighted or FLAIR sequence, showing a cross-section of the brain. The image is divided into four quadrants by a vertical and a horizontal white line. The left hemisphere (viewer's left) shows a prominent, bright, hyperintense lesion in the central region, which is likely a focal area of pathology such as a tumor, abscess, or demyelinating lesion. The right hemisphere (viewer's right) appears relatively normal with no significant focal abnormalities. The overall brain structure, including the gyri and sulci, is visible in shades of gray against a black background.
