SN

This is an axial PET scan of a human brain. The image shows a cross-section of the brain with a color scale from blue (low activity) to red (high activity). A prominent, focal area of increased radiotracer uptake is visible in the left temporal region, indicated by a bright red and yellow spot. The rest of the brain shows relatively low, uniform activity. A white crosshair is overlaid on the image, with the vertical line passing through the center of the brain and the horizontal line passing through the level of the focal uptake.
