S0

This is an axial PET scan of a human brain. The image displays a cross-section with a color scale where blue represents low metabolic activity and yellow/red represents high metabolic activity. A prominent, localized area of high metabolic activity is visible in the central part of the brain, likely corresponding to the basal ganglia or thalamus. The surrounding brain tissue shows relatively uniform, lower-level metabolic activity. A white crosshair is overlaid on the image, with the vertical line passing through the center of the hypermetabolic lesion.
