S0

This is an axial PET scan of a human brain. The image shows a cross-section with a color scale where blue represents low activity and yellow/green represents high activity. A prominent, localized area of high activity is visible in the central region, likely corresponding to the basal ganglia or thalamus. The surrounding brain tissue shows lower, more uniform activity levels. The image is overlaid with a white grid consisting of one vertical and one horizontal line that intersect at the center of the brain.
