M

This is a coronal PET scan of a human brain. The image is split vertically down the middle, likely representing two different scans or conditions. The color scale indicates metabolic activity, with blue representing low activity and yellow/red representing high activity. A prominent area of high activity is visible in the medial frontal region, appearing as a curved, elongated shape. The rest of the brain shows relatively low activity, represented by blue and cyan colors. A white crosshair is centered on the image, with a vertical line and a horizontal line intersecting at the middle.
