Hb

This is an axial brain scan image, likely from a functional imaging technique such as fMRI or PET. The image shows a cross-section of the brain with a color scale where blue represents lower values and yellow/green represents higher values. A prominent, bright yellow-green region is visible in the central part of the brain, possibly indicating a focal area of increased hemoglobin concentration or metabolic activity. The surrounding brain tissue shows a more uniform, lower-level blue signal. A white crosshair is overlaid on the image, intersecting at the center of the brain.
